Data Collection

- Samples every 5 minutes of RMS velocity and high frequency acceleration for X and Z axes
- Determines whether the asset is running, and only uses data when it is running
- Creates baseline over first 300 running samples
- Warning and alarm thresholds are automatically created for each vibration characteristic during baseline period
- Thresholds are set for both acute faults (quickly occurring) and chronic faults (long term deterioration)

HMI shows dashboard with a "Check Engine Light" for each asset
